Be an Army of One

Make "being your own boss" a much easier job with the help of a code generator.

A freelancer must be an army of one; a software architect, project manager, developer, and programmer. Responsibilities include construction and work on the entire project from start to finish. A freelancer has to be able to perform all aspects of application development. This requires a thorough knowledge of database web application development techniques and methods, from design to DAL and BLL. However, being your own team can be exhausting. Without teammates, you have no one to rely on, and no one to shift responsibility to.

However, you don't have to be entirely alone. A sophisticated code generator can be a huge help in your business. It will create an entire web application prototype from scratch, saving many hours of mind-numbing repetitive work. A thoroughly thought-out application will be created in minutes, without any work required on your part. Code generation is the perfect companion to work on any project, and allows you to get a huge head start on building your web application and fulfilling the project requirements.

Imagine that you were hired to create a database web application to maintain a product catalog. You will need to create a page for catalogs, catalog contents, catalog structure, attribute definitions, and other pages. Your customer provides you with access to the database and asks you to create a suitable application. You could start with creating a data access layer, and then create basic pages. This mundane task will require you a few days. Or, you can use an advanced code generator, such as [Code OnTime](http://www.codeontime.com), to quickly create a web application, complete with DAL, BLL, advanced GUI, adaptive filtering and sorting, and many other great features. You can immediately show this prototype to your customer, and move forward on more specific requirements without having to develop all of the boilerplate coding. Your customer will be quite impressed.

Using a code generator allows you to move past all the time-wasting basics of web applications and go directly to the more complicated tasks. It's a lot easier to modify an existing web application than creating a new one. The code generator will create the perfect prototype for your project. It comes with many advanced features already built in, such as advanced reporting, AJAX integration, custom filtering and sorting, fast paging, in-place editing, data validation and error reporting, and database lookups, among many others. The generated code doesn't even have to be used; you can scrap the whole thing. Even then, it has helped you formulate an idea for the design of your web application and communicate it to your customer. You can also use snippets from the generated code in your own application.

Quality code generators use new technologies, and utilizing them can help you keep up with the latest trends. It will help you create web applications much faster than before, and keep the money coming in.
